

## Wireless transmission of embroidery patterns from PC to sewing machine

**Meerbusch, 1 June 2006 – After the tremendous success of silex technology's sewing machine adapters in the USA, the network specialist brings them now also to the European market with the StitchLink II**

Modern embroidery enthusiasts get their embroidery patterns directly from the Internet. A large selection of samples is available there and acquiring embroidery samples online is both simple and fast. The domestic handi-craft fan as well as the professional provider of embroidery no longer has to leave the apartment or the shop in order to get the very latest trends in embroidery or seasonal samples.

Difficulties occur once the pattern has been purchased and the embroidery sample needs to be transferred from the PC to the sewing machine and the machines are not directly next to each other. Nobody wants to carry the heavy and cumbersome machines around the room or through the house. Cables are messy and only add chaos.

The network specialist silex technology took up this inconvenience and with the StitchLink II adapter introduced a comfortable wireless solution for modern embroidery fans as well as for the professional provider.

StitchLink II is the easy way to wirelessly connect the sewing machine and the PC. It works with many embroidery machines equipped with a USB interface. The transfer occurs no differently than if the embroidery machine were locally connected by a cable directly to the PC.

The use of this application couldn't be any easier and works with the software from most sewing machine manufacturers (see compatibility list information in the box below). It even handles transfers of 3D embroidery sample files in .vp3 or .vip formats (3D organizer).

An online support service from silex offers assistance for the installation of the wireless adapter free of charge. With this innovative and comfortable service offering the silex support specialist is able to configure the device for the customer over a remote Internet access.

"Today's creativity in embroidery knows no boundaries. The advances in sewing and embroidery machines within the last few years are impressive. *StitchLink II for VSM* is another step in this direction. It optimizes the interaction of our machines with the computer and the Internet. It offers a better utilization of possibilities, creates synergy and supports creative work. It offers us, and above all else our customers, abundant advantages. Embroidering becomes more comfortable again and sewing machines from Pfaff and Husqvarna Viking are more attractive through this bundling." Mike Harris, Sales President, VSM UK Ltd.
